the 1990s, the number of people in the United States who are 65 years of age or older has increased by 50% (U.S. Census Bureau, 2000). The number of people aged 65 and older is projected to increase to 20% of the total population by the year 2020 (U.S. Census Bureau, 2000). The increase in the number of people aged 65 and older is due to the increase in life expectancy and the decrease in the birth rate. The increase in life expectancy is due to the decrease in the death rate and the increase in the number of years lived in good health. The decrease in the birth rate is due to the decrease in the number of children born to women aged 15 and older. The increase in the number of people aged 65 and older is a major concern for the United States because it will have a significant impact on the economy and the social security system. The increase in the number of people aged 65 and older will lead to an increase in the demand for health care services and a decrease in the labor force. The increase in the number of people aged 65 and older will also lead to an increase in the demand for social security benefits. The increase in the number of people aged 65 and older is a major concern for the United States because it will have a significant impact on the economy and the social security system.
